Recycling E-waste Relaunch at Mexico Office

E-waste, or old electronic products that are no longer usable, is a massive contribution to pollution. Some examples include old TVs, computers, or batteries. E-waste is a risk to the environment and natural ecosystems due to the poisonous leaking of materials when they are not properly disposed of. Soil, water, air, and wildlife can all be seriously affected by the toxic chemicals found in e-waste. To combat this issue, the Kumon office in México has been working with a company that collects electronic waste for recycling. The recycling company then certifies that the e-waste has been responsibly recycled, providing Kumon with a certificate recognizing the donation and a plant as a symbol of the importance of caring for the environment.

Due to the danger that mishandled e-waste represents, Kumon of Mexico is strengthening its efforts to recycle not just e-waste produced at the office, but personal e-waste as well! The goal is for this initiative to grow and help us improve the environment in which we live. In Mexico's office we are very excited to see how this relaunch will increase the awareness of e-waste's impact on the environment and the importance of its proper disposal.
